Pressure sensors are often called pressure transmitters, which convert pressure into analog electrical signals. Due to the existence of various types of pressure sensors on the market, the most common one is the basic strain gauge sensor. The transformation of pressure into electrical signals is achieved through the physical deformation of a strain gauge, which is bonded to the diaphragm of the pressure sensor and connected to a Wheatstone bridge structure. The pressure applied to the pressure sensor usually deflects the film, introducing strain into the gauge.
