The global Pressure Ulcer Foam Dressing market size is predicted to grow from US\$ 1291 million in 2025 to US\$ 1980 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

In 2025, global production of pressure ulcer foam dressings reached approximately 146.7 million units, while total production capacity was estimated at around 195.6 million units. The average unit price was about USD 9.0, and gross profit margins ranged from 60% to 80%, supported by high clinical value and frequent usage in long-term care. Manufacturing emphasizes advanced foam structures, high absorbency, skin-friendly adhesives, and strict sterile packaging standards.

Pressure ulcer foam dressings are specialized wound care products designed to manage moderate to heavy exudate while protecting fragile skin in patients with limited mobility. They provide cushioning, pressure redistribution, moisture balance, and a protective barrier, making them widely used in pressure ulcers, bedridden patient care, postoperative wounds, and chronic wound management.

The industrial chain includes upstream polyurethane or silicone foam materials, absorbent layers, medical adhesives, and backing films. Midstream manufacturing covers foaming, cutting, coating, lamination, sterilization, and packaging. Downstream demand mainly comes from hospitals, long-term care facilities, rehabilitation centers, and home healthcare settings.

The pressure ulcer foam dressing market is driven by aging populations, increasing numbers of immobile patients, and rising awareness of pressure injury prevention. Healthcare systems emphasize early intervention and effective wound management to

reduce complications and long-term treatment costs. Foam dressings are favored for their cushioning, high absorbency, and extended wear time. Product innovation focuses on silicone adhesives, multilayer structures, and enhanced skin protection. These factors support stable and above-average growth in this specialized wound care segment.
