Abstracts

The global Pressureless Sintered Silicon Carbide (PSSiC) Ceramics market size is predicted to grow from US\$ 2455 million in 2025 to US\$ 4397 million in 2032; it is expected to grow at a CAGR of 8.8% from 2026 to 2032.

Pressureless sintered silicon carbide (PSSiC) ceramics means that samples of different shapes and sizes can be densified and sintered at 2000-2150°C by adding appropriate sintering aids without applying external pressure, that is, usually under 1.01×10⁵ Pa pressure and inert atmosphere. Pressureless sintering can be divided into two processes: solid phase sintering and liquid phase sintering.

Driving factors

Excellent product performance

Silicon carbide ceramics have excellent properties such as oxidation resistance, high temperature strength, chemical stability, thermal shock resistance, thermal conductivity and good air tightness. There are almost no substitutes on the market that can easily replace silicon carbide ceramics.

Huge market demand

Silicon carbide ceramics are widely used, with a huge market size and rigid demand.

Technological progress drive

With the increase of market entrants, related R&D investment will also increase

simultaneously, and will further promote technological progress and industry development.

Restrictive factors:

Market access barriers

Downstream industries generally do not easily change suppliers. Many companies maintain long-term and stable cooperative relationships. New entrants are difficult to achieve rapid development in the industry without certification of high-quality customers in related industries.

Technology and experience barriers

Silicon carbide ceramics have very high technical requirements. The rapid development of downstream pan-semiconductor and other industries has made related technology iterations very rapid. Personnel experience and proficiency in the operation of production equipment will also affect the manufacturing level of enterprises. Enterprises need to accumulate relevant technologies and experience in mass production practices for a long time, and understand customer needs in a timely manner to continuously improve related formulas and production processes.

Capital and scale barriers

In order to maintain the leading technology and market competitiveness of products, silicon carbide ceramic companies need to continue to invest in research and development, which requires a large amount of capital. In the initial stage, companies need to invest a lot of money in factory construction and purchase of production equipment, and give full play to the scale effect of production through reasonable and scientific scheduling of production shifts. Due to the large number of models of ceramic material parts, the specific applications and performance requirements are different, and new products face the risk of R&D failure. Without sufficient financial support, it is difficult for new entrants to develop mature products and form a certain scale of operation, and they cannot compete effectively with existing companies in the industry.
