The global Prestained Protein Standard market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

The prestained protein standard is a laboratory reagent used in molecular biology and protein research. It consists of a protein mixture that has been stained and can be used as a molecular weight standard to help determine the molecular weight of the protein in the sample to be tested.

Prestained protein standards are usually composed of multiple proteins of different molecular weights, each of which has been stained with a stain that binds to the protein to allow it to be visualized during gel electrophoresis or other protein analysis techniques. Prestained protein standards are provided in solutions or lyophilized powders of different concentrations to meet different experimental needs.
