The global Prevailing Torque Locknuts market size is predicted to grow from US\$ 84.1 million in 2025 to US\$ 118 million in 2031; it is expected to grow at a CAGR of 5.8% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

A prevailing torque locknut is a self-locking nut that provides resistance to rotation through structural features, such as localized plastic deformation of metal threads (e.g., elliptical deformation, top crimping) or non-metallic inserts (like nylon rings), creating an interference fit with the mating bolt threads. This design ensures that the nut maintains a consistent frictional resistance during installation and under operational conditions, preventing loosening due to vibration, shock, or thermal cycling. Prevailing torque locknuts are widely used in industries such as aerospace, automotive, railways, and heavy machinery, where high resistance to vibration-induced loosening is critical. It's important to note that the locking effectiveness of prevailing torque locknuts may diminish with repeated use, so their reuse should be limited in critical applications.

United States market for Prevailing Torque Locknuts is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
