Making windows bird-safe is a thoughtful and effective way to prevent bird collisions, which can be fatal for birds. Birds can't see clear glass and often fly into windows because they see reflections of the sky or trees, not realizing there's a barrier in their path.

Prevent Birds Hitting Windows is a window designed or modified to reduce or eliminate the risk of bird collisions with the window. Because birds do not recognize ordinary glass windows as obstacles, they may attempt to pass through because they see the reflection of the sky, trees, or other natural features in the window, resulting in a collision with the window that often results in bird injury. or death. Bird-safe windows protect birds from harm by using specific design and technology to help birds identify or avoid windows. These measures include, but are not limited to: stickers or markings on windows, specially patterned glass (such as dotted glass or patterned glass), hanging nets outside windows, the use of reflective tapes or coatings, etc. By implementing these strategies, people can reduce bird-building collisions, thereby protecting wild birds and improving their survival rates.
