Intra-abdominal adhesions are the pathological connections between the greater omentum, abdominal organs and abdominal wall after surgery, and are a common complication after abdominal surgery. The clinical symptoms are mostly intestinal obstruction, chronic abdominal pain, female infertility, etc. It increases the rate of secondary operations, prolongs the length of hospital stay, and imposes a heavy disease and economic burden on patients and their families. Ideal anti-adhesion barrier material: good biocompatibility; suitable tissue adhesion (no need for suture); can completely cover the wound surface and have sufficient retention time in the body; can be degraded and absorbed without the need for secondary surgery It can be taken out; it can effectively prevent the formation of adhesions without affecting the normal healing of the wound; it has a certain mechanical strength and is easy to operate.
