The global Primary Current Injection Tester market size is predicted to grow from US$ 111 million in 2025 to US$ 142 million in 2031; it is expected to grow at a CAGR of 4.3% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

A Primary Current Injection Tester is a specialized electrical testing device used to simulate high current faults and validate the performance of primary protection systems in power distribution networks. Unlike secondary injection testers that assess protective relays by bypassing the entire system, primary current injection testers deliver high primary currents—often in the range of hundreds to tens of thousands of amperes—directly through circuit breakers, current transformers (CTs), and protective relays, thereby testing the full protective path under near-real operating conditions. These testers typically consist of a current source, control unit, and monitoring capabilities, and can be configured as portable or modular systems. They are commonly used for testing circuit breakers (to verify trip characteristics), protection relays (especially overcurrent, differential, and ground fault types), CT saturation points, and the continuity of busbars and cabling. Applications span utilities, substations, switchgear maintenance, and commissioning of power systems. Advanced models often include automatic control, digital timing, programmable sequences, and built-in safety interlocks.

United States market for Primary Current Injection Tester is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
