## Abstracts

The global Primary Human Cell market size is predicted to grow from US\$ 685 million in 2025 to US\$ 1216 million in 2032; it is expected to grow at a CAGR of 8.7% from 2026 to 2032.

Primary cells refer to the initial cells derived from living tissues and prepared by specific separation methods.

The primary cells have been isolated for a short time and have not undergone the immortalization process. Their biological characteristics have not changed much, and they still maintain the original genetic characteristics, which can better reflect the growth status of cells in vivo, so as to obtain physiological functions in vivo. The closer data is very suitable for experimental research such as drug testing, cell differentiation and transformation.
