According to this study, the global Printed Circuit Board Laminate market size will reach US\$ million by 2031.

Lamination is a technique wherein the material is permanently assembled by heating, pressuring, welding, or by use of adhesives. This technique improves the properties of a material such as strength, durability, appearance, stability, and others. Printed circuit board (PCB) laminate involves lamination of a circuit with a non-conductive material. PCB laminates connect and support the electronic components using pads, conductive tracks, and other features etched from copper sheets laminated onto a non-conductive substrate. PCB laminations are widely used in one copper layer PCB, two copper layer PCB, or outer & inner layer PCB.

According to our Semiconductor Research Center, the global total output value of PCB was about US\$ 81 billion in 2022. With strong drivers from new technology, such as AI, 5G and new energy vehicles, it is estimated that the PCB industry will continue to grow steadily in the next six years. Global PCB manufacturers are mainly located in China mainland, China Taiwan, Japan, South Korea, Europe and the United States. Among them, Chinese local PCB companies hold the biggest share.
