## Abstracts

The global Printed Color Electronic Paper (PCeP) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Printed color e-paper (PCeP) is a new type of electronic display technology that combines the advantages of e-paper display technology and color printing technology. Printed color e-paper (Print-Color ePaper, PCeP) is a new type of color e-paper technology independently developed and manufactured by E Ink. This technology achieves color display effects by superimposing color filters on black and white e-paper. PCeP not only maintains the reading comfort and low power consumption characteristics of black and white e-paper, but also greatly improves the color richness and visual effects of the display.

PCeP technology is suitable for reading, education and business applications, and can be used to produce e-paper readers, e-paper notebooks, digital signage and other products. As technology continues to mature and costs decrease, PCeP is expected to be widely used in more fields.

The development status and dynamics of the printed color electronic paper (PCeP) market can be summarized from the following aspects:

First, with the rise of global digital reading and sustainability trends, color electronic paper is gradually gaining favor for its low energy consumption, eye protection and environmental protection characteristics. Especially in the fields of e-book readers, digital signage, smart wearable devices, etc., the demand for color electronic paper is growing. The increasing demand of consumers for healthy and environmentally friendly

products, as well as the unique advantages of electronic paper technology in reading experience, have further promoted the expansion of the printed color electronic paper market.

Secondly, printed color electronic paper technology controls the movement of particles by applying an electric field to achieve color display effects. In recent years, this technology has made significant progress in color saturation, resolution and refresh rate. There are many products based on printed color electronic paper technology on the market, such as E Ink Gallery series of E Ink Technology and cholesterol liquid crystal technology of Iridescent Optoelectronics, which are constantly optimized in display effects and application scenarios.

In addition, the supply chain of printed color electronic paper covers raw material supply, panel manufacturing, driver chip and control system integrators, and final equipment manufacturers. Effective supply chain management is essential to ensure product quality, reduce costs and improve market response speed. However, since large-scale production has not yet been formed, the price of film materials remains high, but with the maturity of technology and market recognition, production costs are expected to gradually decrease.

In summary, the printed color e-paper market is in a rapid development stage. With the continuous maturity of technology and further market recognition, printed color e-paper is expected to be widely used in more fields.
