Printing-grade thermal paper is a special processed paper. Its manufacturing principle is to coat a layer of 'thermosensitive coating' (also called thermochromic layer) on the base paper. This coating contains chemical substances that can change color at a specific temperature, such as colorless dyes, color developers, sensitizers, fillers, adhesives, stabilizers and lubricants. These ingredients enable printing-grade thermal paper to change color quickly when it is exposed to a thermal print head or other heat source, so that it can be used to print or record information.

The global Printing Grade Thermal Paper market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
