## Abstracts

The global Probe Card for Wafer Testing market size is predicted to grow from US\$ 1996 million in 2025 to US\$ 2658 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

A probe card is an interface between an electronic test system and a semiconductor wafer. Typically the probe card is mechanically docked to a prober and electrically connected to a tester. Its purpose is to provide an electrical path between the test system and the circuits on the wafer, thereby permitting the testing and validation of the circuits at the wafer level, usually before they are diced and packaged. It consists, normally, of a printed circuit board (PCB) and some form of contact elements, usually metallic, but possibly of other materials as well.

Since the probe card for wafer testing is one of the indispensable instruments in semiconductor testing, the demand for probe cards will continue to increase in the production and use of semiconductors. In addition, with the continuous improvement and improvement of probe card technology, it will bring more convenience and advantages to the semiconductor industry. In the future, probe cards can also realize automated testing, thereby greatly improving testing efficiency and accuracy.
