The global Probe Station Systems market size is predicted to grow from US\$ 1679 million in 2025 to US\$ 2530 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

The probe station is a device that tests the electrical characteristics of all chips formed on the wafer. This device can be used to screen good and bad chips. It is mainly used in the semiconductor industry, optoelectronics industry, integrated circuit and packaging testing, and is widely used in the research and development of precision electrical measurements of complex and high-speed devices, aiming to ensure quality and reliability, and reduce research and development time and device manufacturing process costs.

At present, the explosive growth of global demand for artificial intelligence (AI) and high-performance computing (HPC) has accelerated the development progress of cutting-edge technologies, the commercialization of products, market development, and the layout of the industrial chain, effectively driving the market demand for related computing power and storage chips. After two years of technological improvements and ecological construction, emerging consumer electronic products such as smart wearable devices and smart homes have given birth to hot products such as AppleVision, becoming an important driving force for the growth of the semiconductor market. Automotive electronics, lithium batteries, photovoltaics and other previous high-speed growth fields have entered a critical window period for technology route selection and technology pattern reconstruction. New formats and models such as industrial Internet, smart medical care, and smart cities are accelerating their transformation, empowering social development and bringing about an increase in overall semiconductor market demand. According to statistics from the World Integrated Circuit

Association (WICA), the global semiconductor market size in 2024 will be US\$620.2 billion, a year-on-year increase of 17%.

From the perspective of product structure, it is expected that the two main integrated circuit categories will drive market growth with double-digit growth, with logic chips expected to grow by 21% and memory expected to grow by 61.3%. Other categories such as discrete devices, optoelectronic devices, sensors and analog chips are expected to show a negative growth of 2%-10%. Thanks to the surge in demand for computing chips from AI big models such as ChatGPT, the market growth rate of logic chips such as GPU, FPGA, and ASIC in 2024 will be 4 percentage points higher than the industry average. The current market demand for Hopper remains strong, and AI manufacturers expect continued growth in Blackwell. With the repeated computing upgrades of AI big models, the market demand for high-performance logic chips will continue to rise in the future. By 2030, the semiconductor market size is expected to reach US\$1 trillion, with a compound annual growth rate of approximately 8%.

Wafer testing is an important step performed in the manufacturing process of semiconductor devices. In this step, all individual integrated circuits present on the wafer are tested for functional defects by applying special test modes to them before the wafer is sent to chip preparation. Semiconductor Probe Station Systems play a vital role in chip manufacturing. According to our data, global semiconductor probe station sales in 2024 were 27,000 units, and are expected to exceed 40,000 units by 2030, with a compound annual growth rate of approximately 5.7%.

In the global competition landscape of semiconductor Probe Station Systems, Tokyo Seimitsu, Tokyo Electron, and Semis occupy a large market share. In 2024, CR3 is as high as 70%, and the market concentration is relatively high. In the Chinese (including Taiwan) market, high-end semiconductor Probe Station Systems are dominated by imports from the international market (Tokyo Seimitsu, Tokyo Electron, Semis, etc.), and low-end and mid-end products have begun to form a trend of domestic substitution. As the country pays more and more attention to independent technology research and development and policy support, it is expected that the domestic market will have great potential in the future.

Semiconductor Probe Station Systems can be divided into three types according to the degree of automation: manual, semi-automatic, and fully automatic. The low-cost advantages of manual and semi-automatic probe station instruments are mainly used in small-batch R&D tests. The advantages of fully automatic Probe Station Systems are their high degree of automation, high precision and versatility, which can greatly

improve test efficiency and accuracy. They are mainly used in OSAT and IDMs, etc. According to our data, the revenue of fully automatic semiconductor Probe Station Systems will account for more than 80% in 2024.

The downstream customers of the semiconductor probe station industry chain mainly include integrated device manufacturers (IDMs), outsourced packaging and testing companies (OSATs), etc. According to research, OSATs currently account for more than 60% of the market share. In general, the growth in demand for semiconductor probe station equipment ultimately depends on the growth in the scope of chip applications, the increase in chip demand, the diversification of chip design models by chip design companies, and the change in the number of chips produced by foundries. With the main line of 'high precision + intelligence', along with the iteration of semiconductor processes and the application of new materials, the technology and market potential of Probe Station Systems will be further released.
