The global Product Marking Software market size is predicted to grow from US\$ 823 million in 2025 to US\$ 1263 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Product Marking Software is a type of digital tool designed specifically for industrial production, commodity circulation and other scenarios. Its core function is to realize the design, editing, typesetting, and drive output of product identification information, and to seamlessly link with marking equipment (such as laser marking machines, inkjet printers, pneumatic marking machines, thermal transfer marking machines, etc.) to generate identification content on product surfaces or packages that comply with regulations, standards, or corporate needs. Its core goal is to ensure the accuracy, consistency and traceability of product identification, adapt to diverse scenarios such as manufacturing automated production lines, food and drug traceability, and electronic product anti-counterfeiting, and has the core features of strong equipment compatibility, label customization, data linkage, and compliance adaptation.

Flexible production and intelligent manufacturing upgrades in the manufacturing industry have promoted the transformation of product marking software from 'passive operating tools' to 'active intelligent systems'. On the one hand, the software integrates technologies such as machine vision and AI algorithms to realize automatic identification of marking positions and real-time correction of deviations, adapting to the high-precision marking requirements of special-shaped parts and precision parts, and solving the problems of large errors and low efficiency in traditional manual positioning. At the same time, the AI-driven marking quality detection function is popularized and can automatically identify fuzzy codes, incomplete codes, and error codes and trigger alarms to ensure the marking pass rate. On the other hand, the software is deeply

adapted to automated production lines and supports linkage with robots, conveyor belts and other equipment to realize the full-process unmanned operation of 'product arrival - automatic marking - quality inspection - data upload'; for flexible production scenarios of multiple varieties and small batches, the software provides a one-click template switching function to quickly match the marking rules of different products, shorten production change time, and improve the flexibility of the production line.
