## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

A Product Rejection Device is a mechanism or system integrated into a production line or manufacturing process that automatically identifies and removes defective or non-conforming products. These devices use sensors, cameras, or other inspection tools to detect flaws such as incorrect dimensions, missing components, or deviations from quality standards. Once a defect is identified, the device triggers an action—such as diverting the faulty item to a reject bin—ensuring that only products meeting quality criteria proceed to the next stage of production or reach the customer. This helps maintain product quality and reduce waste or customer dissatisfaction.

The global Product Rejection Device market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
