Profile Scanning Sonar is a type of high-resolution sonar system designed to produce detailed, cross-sectional (profile) images of underwater environments. Unlike multibeam or forward-looking sonar that generate wide-area or 2D images, profile scanning sonar captures a precise vertical or horizontal slice of the underwater scene by rotating a single narrow beam across a plane. This capability makes it ideal for structural inspections, tunnel surveys, and sediment profiling.

United States market for Profile Scanning Sonar is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
