Profiling winch is a mechanical device used in scientific and research expeditions to deploy and retrieve instruments or sensors in bodies of water. It is typically mounted on a research vessel or platform and consists of a drum or spool that holds a cable or wire. The cable is connected to the instrument or sensor and is wound or unwound by the winch, allowing for controlled lowering and raising operations. The winch is equipped with features such as speed controls, tension sensors, and depth sensors to ensure the safe and precise deployment and retrieval of instruments. Profiling winches are commonly used in oceanography, hydrogeology, and environmental studies to collect data profiles at different depths, such as temperature, salinity, pressure, and current measurements. The winch enables researchers to vertically sample the water column, providing valuable insights into the physical and chemical properties of the aquatic

environment.
