A programmable temperature sensor is a sensor that can measure temperature and control it through programming. It can be programmed according to the user's needs to achieve various functions, such as setting alarm temperature, adjusting heating or cooling system, recording temperature data and so on. Usually, a programmable temperature sensor consists of a temperature sensor and a microprocessor, and the microprocessor can control the way of measuring temperature and output results according to the parameters preset by the user. This sensor can usually communicate with other devices such as microcontrollers, microcontrollers or computers through digital interfaces such as I2C or SPI. Programmable temperature sensors are common in many applications such as industrial automation, environmental monitoring, medical equipment, automotive, and more. They are widely used in many applications due to their advantages of precise measurement, programmable control, easy integration and energy saving.
