The global Propeller Polishing Service market size is predicted to grow from US\$ 551 million in 2025 to US\$ 847 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Propeller polishing services are professional and meticulous maintenance and optimization services for the surface of ship propellers. Through cleaning, polishing, and mirror-finishing of the propeller blade surface to remove dirt, corrosion, deposits, and micro-roughness, the hydrodynamic performance is restored or improved. The core objectives of this service are to reduce water resistance, minimize cavitation effects, improve propulsion efficiency, and ultimately reduce fuel consumption and optimize carbon emissions. As a key technical means in ship energy management systems, propeller polishing is typically implemented concurrently with periodic ship maintenance, underwater inspections, and performance assessments, playing a significant role in improving shipping economics and operational stability.

Against the backdrop of the global shipping industry's continuous pursuit of energy conservation, emission reduction, and carbon neutrality goals, improving ship energy efficiency has become a key industry focus. Propeller polishing, as a relatively low-cost optimization method with direct and quantifiable energy-saving effects, is experiencing steady market demand growth. With fluctuating fuel prices and increasingly stringent international environmental regulations, shipping companies are placing greater emphasis on optimizing operating costs through maintenance, transforming this type of service from a 'periodic maintenance project' into a 'routine energy efficiency management measure.' In the future, this field will be deeply integrated with remotely operated vehicles (ROVs), autonomous underwater vehicles (AUVs), and intelligent visual inspection technologies to achieve automatic identification of propeller conditions,

assessment of fouling, and precise polishing operations. This will reduce reliance on manual diving operations and improve operational safety and standardization. Simultaneously, combined with digital ship management systems and performance data analysis, propeller polishing services will further develop towards intelligent, automated, and predictive maintenance, becoming an important technological component of the green shipping system.
