Propeller Shaft Grounding Systems are electrical grounding systems used in maritime vessels to prevent or mitigate damage caused by stray electrical currents. These systems typically consist of one or more grounding brushes or grounding rings installed around the propeller shaft within the ship's hull. When the ship is in operation, these brushes or rings make electrical contact with the rotating propeller shaft, providing a low-resistance path for stray electrical currents to dissipate harmlessly into the surrounding seawater. By effectively grounding the propeller shaft, these systems help prevent corrosion and damage to vital components such as bearings and seals, as well as reducing the risk of electrical interference with sensitive onboard electronics and communication systems.

The global Propeller Shaft Grounding Systems market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
