The global Propidium Iodide market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Propidium Iodide (PI) is a fluorescent dye commonly used in cell biology and flow cytometry to assess cell viability and identify dead cells. It works by binding to nucleic acids, particularly DNA, but it is impermeable to live cells with intact membranes. When used in conjunction with a suitable fluorescence microscope or flow cytometer, PI can selectively stain cells with compromised membranes, such as dead or apoptotic cells, emitting a red fluorescence upon binding to DNA. This enables researchers to quantify cell death, evaluate cytotoxicity, and study cell cycle progression in various biological samples with high specificity and sensitivity.
