The global Propofol Injectable Emulsion market size is predicted to grow from US\$ 1394 million in 2025 to US\$ 1796 million in 2032; it is expected to grow at a CAGR of 3.8% from 2026 to 2032.

In 2024, global propofol injectable emulsion production reached approximately 376 million units, with an average global market price of around US\$ 3.7 per unit. Propofol is a short-acting, intravenous anesthetic agent used for the induction and maintenance of general anesthesia, sedation for mechanically ventilated adults, and procedural sedation. Propofol has the advantages of fast onset of anesthesia induction, rapid awakening, perfect functional recovery, and low incidence of adverse reactions such as postoperative nausea and vomiting. Propofol injectable emulsion is a sterile, nonpyrogenic emulsion containing propofol suitable for intravenous administration. Its gross profit margin generally ranges from 50% to 80%.

Increasing Demand:

The demand for propofol is increasing, driven by the rising incidence of chronic diseases, surgeries, and medical procedures. The aging population, changing lifestyles, and growing healthcare infrastructure in emerging markets are also contributing to the increasing demand for propofol.

Technological Advancements:

Advances in drug delivery systems and monitoring technologies are enhancing the use of propofol. Innovations such as target-controlled infusion (TCI) systems allow for more precise administration, improving safety and efficacy.

Expanding Applications:

Beyond traditional surgical and diagnostic procedures, propofol's applications are expanding into areas such as pediatric anesthesia, veterinary medicine, and even in treating certain psychiatric disorders like refractory depression through off-label use.

Intensified Competition:

Competition among manufacturers will intensify further in the coming years. In addition, propofol substitutes will try to occupy more market share.
