The global Proportional Polyphosphates Dosing Unit market size is predicted to grow from US$ 1241 million in 2025 to US$ 1566 million in 2031; it is expected to grow at a CAGR of 3.9% from 2025 to 2031.

Proportional polyphosphates dosing unit is an automated dosing device designed for water treatment systems to solve the common scaling problem in domestic and industrial water systems. During the heating process, calcium and magnesium ions in water will react chemically to form precipitates such as calcium carbonate, which will adhere to the heat exchange surface of the hot water production system, resulting in reduced system efficiency and even failure. To prevent this problem and comply with relevant national standards and boiler manufacturers' recommendations, it is necessary to install a proportional polyphosphates dosing unit. The proportional polyphosphates dosing unit ensures that the concentration of polyphosphates is always kept within the regulatory range through continuous and stable dosing, while maintaining the activity of its scale and corrosion inhibition properties. This control method not only improves the accuracy and efficiency of dosing, but also helps to extend the service life of water treatment equipment and reduce maintenance costs. The device is suitable for various types of gas/electric boilers and water heaters, providing a highly efficient and reliable water treatment solution for domestic and industrial users.

United States market for Proportional Polyphosphates Dosing Unit is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
