A proportional valve for a ventilator is a type of control valve that regulates the flow of air or oxygen within a ventilator system based on a proportional signal, allowing precise adjustments of airflow and pressure according to the patient's respiratory needs. These valves offer features such as high precision, fast response time, and smooth regulation, ensuring consistent and accurate control of the gas flow to provide optimal ventilation support. They are typically used in medical ventilators and respiratory equipment, where maintaining accurate airflow and pressure is critical for patient safety and effective treatment. The valve's ability to adjust in real-time to changing patient conditions makes it essential in applications like critical care, anesthesia, and intensive care units (ICUs), where precise control of ventilation is vital for supporting breathing functions.
