The global Propylene Oxide Catalyst market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Epoxy propane catalyst (HPPO) is a catalyst used in the direct oxidation process of propylene/hydrogen peroxide to synthesize epoxy propane. HPPO catalyst has the characteristics of high activity, long service life, and good stability. The process of synthesizing epichlorohydrin by propylene/hydrogen peroxide method meets the requirements of green chemistry, with outstanding advantages of mild conditions and good safety, especially with inherent cleanliness, making it a truly green chemical process. At present, the main methods used for industrial production of epichlorohydrin worldwide include high-temperature chlorination of propylene, glycerol method, and acrylic acetate method. However, there are issues such as excessive by-products, severe environmental pollution, and low atomic economy that urgently require green transformation. Titanium silicate molecular sieve catalyzed epoxidation of chloropropene to directly prepare epichlorohydrin has the advantages of no pollution, high selectivity, and mild reaction conditions, which is one of the effective ways to solve the above problems. The primary purpose of direct epoxidation of chloropropene is to avoid issues such as high energy consumption and equipment corrosion. Directly carry out epoxidation reaction to generate epichlorohydrin. Not only does it have mild reaction conditions, short process flow, and low emissions of 'three wastes', but it also improves the yield of epichlorohydrin. Very in line with the requirements of 'green chemistry concept' and 'atomic economy'.
