The global Prostate Cancer Hormone Therapy market size is predicted to grow from US\$ 13510 million in 2025 to US\$ 22910 million in 2032; it is expected to grow at a CAGR of 8.0% from 2026 to 2032.

Hormone therapy for prostate cancer is a treatment that stops the hormone testosterone either from being made or from reaching prostate cancer cells. Most prostate cancer cells rely on testosterone to grow. Hormone therapy causes prostate cancer cells to die or to grow more slowly.

The prostate cancer hormone therapy market is evolving rapidly, driven by factors like:

Rising prostate cancer diagnosis: Prostate cancer remains the most common cancer among men in many countries. Early diagnosis and improved treatment options have contributed to increasing survival rates, fueling market growth.

Shifting treatment trends: Hormone therapy, which aims to lower testosterone levels and starve prostate cancer cells, is a cornerstone treatment for advanced and recurrent prostate cancer. Advancements in medication and targeted therapies are shaping the market landscape.

Personalized medicine: Growing understanding of cancer genomics and individual variations in response to therapy is leading to the development of personalized treatment plans, including targeted hormone therapies with fewer side effects.

Drug landscape: A variety of drugs belonging to different classes, like GnRH agonists, antagonists, and androgen receptor inhibitors, cater to diverse patient needs and

treatment stages.
