The global Prostate Cancer PARP Inhibitor Drugs market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Poly ADP-ribose polymerase (PARP) is a DNA repair enzyme involved in the single-strand repair process of DNA. PARP inhibitors (PARPi) inhibit PARP activity through two mechanisms: direct inhibition of PARP function and PARP trapping, resulting in the stalling and collapse of replication forks, resulting in fatal double-strand breaks. Normal cells can repair double-strand breaks in time and correctly through homologous recombination repair (HRR); however, in tumor cells carrying HRR gene mutations, due to the impairment or loss of HRR function, the accumulated double-strand breaks will not be repaired in time and correctly, resulting in The tumor cell genome is unstable and eventually induces tumor cell death.

The global pharmaceutical market is 1475 billion USD in 2022, growing at a CAGR of 5% during the next six years. The pharmaceutical market includes chemical drugs and biological drugs. For biologics is expected to 381 billion USD in 2022. In comparison, the chemical drug market is estimated to increase from 1005 billion in 2018 to 1094 billion U.S. dollars in 2022.
