Prostate stents are medical devices used to keep open the space surrounding prostatic urethra and bladder neck in order to allow smooth urine flow in case of urine incontinence. These stents are effective in alleviating the bladder outlet obstruction resulted from benign prostatic hyperplasia (common among men aged above 70 years). However, a prostate stent should not be positioned too proximal to the external sphincter because it could cause urine incontinence. Other complications caused by prostate stents include risk of formation of bladder stones and granulation tissues. Additional formation of tissue surrounding the stent could obstruct the normal urine flow.
