The prosthetic torsion adapter is a precision mechanical device designed to compensate for the missing joint function of the human body. Through the internal springs, dampers and adjustment mechanisms, it can simulate the motion characteristics and torque changes of real joints and adapt to the different torque requirements under different motion states. This adapter is usually made of high-strength lightweight materials to ensure that it is strong and does not bring additional burden to the user. Its internal structure can be adjusted according to the specific situation and activity intensity of the user. The adapter has a rotation function, allowing the prosthesis to rotate within a range of up to 40 degrees, thereby better simulating the movement of the natural joints of the human body, ensuring that the prosthesis can synchronize with the user's own movements in various activities such as walking, running, and climbing stairs, reducing energy waste and potential injuries. The prosthetic torsion adapter also has a buffering effect, absorbing energy when impacted, protecting the residual limb from injury, while improving the comfort and safety of overall movement.
