The global Protein Biochip market size is predicted to grow from US\$ 431 million in 2025 to US\$ 814 million in 2032; it is expected to grow at a CAGR of 9.5% from 2026 to 2032.

Protein biochips are microarray-based platforms designed for the parallel detection, quantification, and functional analysis of proteins, enabling high-throughput profiling of protein expression, interactions, and biomolecular activity. These biochips are widely used in proteomics research, biomarker discovery, drug development, and translational medicine. In 2025, the average global selling price of protein biochips is approximately US\$420 per chip, with global shipment volume reaching around 1.05 million units. The industry typically maintains a gross margin range of 45%-70%, supported by high technical barriers, proprietary surface chemistry, assay specificity, and strong demand from life science research and clinical research markets. The value chain includes upstream substrates and surface functionalization materials, midstream biochip design and manufacturing specialists, and downstream research institutions, pharmaceutical companies, and diagnostic developers.

In 2025, the protein biochip market continues to expand as proteomics becomes an essential component of biomedical research and precision medicine. Growth is driven by increasing demand for multiplex protein analysis, biomarker validation, and high-throughput screening in drug discovery. While the market remains research-oriented, gradual translation into clinical research and companion diagnostics is creating new opportunities. Competitive differentiation is increasingly defined by assay reproducibility, surface chemistry performance, data quality, and integration with downstream analytical workflows.
