Abstracts

According to this study, the global Protein Electrophoresis market size will reach US\$ million by 2031.

Protein electrophoresis is a test that measures specific proteins in the blood. The test separates proteins in the blood based on their electrical charge. In the alkaline environment, serum proteins are negatively charged and swim towards the anode in the electric field. Due to the difference in the isoelectric point and molecular weight of each protein, small molecular weight and more negatively charged proteins swim the fastest. Those with large molecular weight and low negative charge swim more slowly. After electrophoresis, starting from the anode, there are five zones: albumin, α_1 globulin, α_2 globulin, β globulin and γ .

United States market for Protein Electrophoresis is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
