The global Protein G Affinity Resin market size is predicted to grow from US\$ 80.22 million in 2025 to US\$ 132 million in 2032; it is expected to grow at a CAGR of 7.4% from 2026 to 2032.

Protein G affinity media are antibody purification materials in which recombinant Protein G ligands are covalently immobilized onto solid supports such as agarose, magnetic beads, or synthetic polymer matrices, forming affinity chromatography resins for immunoglobulin capture. These media are primarily used to bind, isolate, and purify IgG antibodies and antibody fragments from sources such as serum, ascites fluid, cell culture supernatants, and immune complexes. Compared with Protein A, Protein G exhibits a broader binding profile, particularly showing improved affinity toward mouse IgG1, human IgG3, certain rat subclasses, and a wider range of polyclonal IgGs. Product formats include bulk resins, prepacked columns, spin columns, plate-based formats, and magnetic beads. The estimated gross margin is approximately 62%.

Protein G media serve as a complementary rather than substitutive tool within antibody purification workflows. While the overall market size is smaller than Protein A media, demand remains stable in research, diagnostic development, antibody screening, and small-scale purification applications. The key value lies in its broader IgG binding spectrum, making it essential in cases where Protein A exhibits insufficient binding due to species or subclass limitations. Accordingly, customers prioritize binding coverage, nonspecific adsorption, ligand leakage, and batch-to-batch consistency over price alone.

Demand growth is mainly driven by increasing antibody discovery programs, routine adoption of immunoprecipitation and co-immunoprecipitation techniques, outsourced

research-grade antibody production, and automation of small-scale purification workflows. Magnetic bead and plate-based formats benefit from high-throughput screening applications, while agarose-based resins and prepacked columns are more commonly used in laboratory-scale purification and method development.

The competitive landscape is dominated by global suppliers such as Cytiva, Thermo Fisher, and Merck, which benefit from established workflows and method continuity. Chinese manufacturers are gradually expanding in agarose-based media, prepacked formats, and customized specifications. Future growth is expected to come from improved binding capacity, reduced ligand leakage, automation compatibility, and bundled Protein A/G/L product portfolios rather than pure price competition.
