The global Protein Purification and Isolation market size is predicted to grow from US\$ 8310 million in 2025 to US\$ 12510 million in 2031; it is expected to grow at a CAGR of 7.1% from 2025 to 2031.

Protein purification is a series of processes intended to isolate a single type of protein from a complex mixture. Protein purification is vital for the characterization of the function, structure and interactions of the protein of interest. The starting material is usually a biological tissue or a microbial culture. The various steps in the purification process may free the protein from a matrix that confines it, separate the protein and non-protein parts of the mixture, and finally separate the desired protein from all other proteins. Separation of one protein from all others is typically the most laborious aspect of protein purification. Separation steps may exploit differences in (for example) protein size, physico-chemical properties, binding affinity and biological activity. Biodetergents such as Triton-X, n-Octyl- β -D-Glucopyranoside, and CHAPS are commonly used for solubilizing, extracting, and purifying membrane proteins.

Global Protein Purification and Isolation key players include Thermo Fisher Scientific, Merck KGaA, Cytiva (Danaher), Agilent Technologies, Bio-Rad Laboratories, etc. Global top five manufacturers hold a share over 51%.

North America is the largest market, with a share over 40%, followed by Europe, and Latin America, both have a share over 30 percent.

In terms of product, Reagents and Consumables is the largest segment, with a share

about 85%. And in terms of application, the largest application is Academic Research Institution, with a share of 42%..
