Abstracts

The global Proximal Phalanx Model market size is predicted to grow from US$ 27.75 million in 2025 to US$ 39.98 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2024, global Proximal Phalanx Model production reached approximately 0.44 M units, with an average global market price of around US$ 31.8 per unit.The proximal phalanx model is an anatomical model used in medical education and research. It simulates the structure, morphology, and pathological characteristics of the proximal phalanx of the human toe. This model is widely used in anatomy teaching, orthopedic clinical training, rehabilitation medicine, biomechanical research, and personalized prosthesis design. By utilizing highly realistic materials and precise 3D reconstruction technology, it helps learners and clinicians better understand the toe skeletal system and related diseases.

Core Structural Features

Material Selection: Common materials include polymer resins, polyurethane, silicone, and composite materials, with some products simulating bone hardness.

Joint Interlocking Design: Can connect to the middle and distal phalanges to demonstrate joint motion.

Pathology Extensions: Some versions demonstrate fractures, deformities, osteoarthritis, and other lesions.

Compatibility with Teaching and Research: Supports cross-sectional observation and functional loading experiments, and some models support transparency or color
