PSA hydrogen production molecular sieve is a key material used in Pressure Swing Adsorption (PSA) technology for hydrogen production. The PSA process relies on the molecular sieve's selective adsorption of different gas molecules under varying pressure conditions to separate hydrogen from impurities. The molecular sieve selectively adsorbs impurities such as carbon monoxide, carbon dioxide, and methane, resulting in high-purity hydrogen. PSA hydrogen molecular sieves feature high selectivity, large adsorption capacity, and good regeneration performance, making them widely used in hydrogen production in industries like petrochemicals.
