The global Pseudarthrosis Treatment market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Pseudoarthrosis, also known as bone non-union, occurs when bones fail to properly fuse after trauma or surgery. This condition manifests through symptoms such as discomfort, stiff joints, and a reduced range of motion. Various therapeutic approaches are employed to treat pseudoarthrosis, including medication therapy, electrical stimulation devices, bone grafting, and surgery.

Surgeons sometimes perform spinal fusion surgery to address issues with the vertebrae, the bones forming the spine. This procedure involves merging the vertebrae into a single, solid bone to aid in scoliosis correction, fracture repair, and spinal stability. Pseudoarthrosis occurs when these bones fail to fuse correctly.

The increasing incidence of pseudoarthrosis, driven by factors such as high-impact trauma injuries, osteoporosis, and other bone-related conditions, is fueling the demand for effective treatment options. As more individuals experience bone non-union, the global need for specialized treatment solutions continues to rise.
