The global Pseudocumene market size is predicted to grow from US$ 398 million in 2025 to US$ 485 million in 2031; it is expected to grow at a CAGR of 3.4% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Pseudocumene, also known as 1,2,4-Trimethylbenzene, a flammable colorless liquid with a strong odor, occurs naturally in coal tar and petroleum. It is a major component (typically 40%) of a petroleum refinery distillation fraction known as the C9 aromatic fraction (or simply the C9 fraction).

Pseudocumene is widely used as an intermediate in the production of various chemicals, including trimellitic anhydride, which is used in plasticizers, resins, and coatings. The growing demand for petrochemical products and derivatives drives demand for trimethylbenzene.

Pseudocumene is derived from petroleum, and fluctuations in crude oil prices can directly impact production costs. The volatility of crude oil markets, driven by geopolitical tensions, supply chain disruptions, and fluctuating global demand, creates uncertainty in pricing.
