Abstracts

The global PSMA-PET Tracer market size is predicted to grow from US$ 1731 million in 2025 to US$ 2839 million in 2032; it is expected to grow at a CAGR of 7.4% from 2026 to 2032.

In 2025, the global production of PSMA?PET tracer reached 3,539,400 units, with an average selling price of US$500 per unit. The global annual production capacity of PSMA?PET tracer was approximately 5,000,000 units, and the gross margin was about 30.4%. PSMA?PET tracer is a radiopharmaceutical used for the diagnosis and staging of prostate cancer. PSMA (prostate?specific membrane antigen) is a membrane protein that is highly expressed on the surface of prostate cancer cells but shows very low expression in normal tissues. PET tracers are agents labeled with positron?emitting radionuclides that can be visualized by PET scanning. The active ingredients in the tracer, such as PSMA?617 and PSMA?11 ligands, specifically bind to PSMA protein, and the carried radionuclides (e.g., ??Ga, ??F) emit positrons, which are detected by PET scanning to precisely locate prostate cancer lesions. The upstream of PSMA?PET tracer includes radionuclides (such as gallium?68, fluorine?18, etc.), PSMA?targeting ligands (small molecules, peptides, or antibodies), and nanocarriers/chelating agents. The midstream consists of manufacturers of PSMA?PET tracer, and the downstream is mainly applied in nuclear medicine and molecular imaging, precision diagnosis of tumors, and radiopharmaceuticals and nuclear medicine.

The current market for PSMA?PET tracer is experiencing rapid growth, mainly fueled by the rising demand for precision diagnosis and treatment of prostate cancer, along with continuous advances in molecular imaging and radiopharmaceutical technologies. This tracer has progressively expanded from early research settings into routine clinical practice, playing an increasingly important role in initial staging, biochemical recurrence detection, and treatment response assessment for prostate cancer. Despite its broad clinical potential, the market still faces challenges such as regional distribution

constraints caused by short radionuclide half?lives, insufficient standardization in production and quality control, and discrepancies in reimbursement policies and clinical guidelines across different countries and regions. At the same time, active research into novel ligand design, radionuclide labeling optimization, and multimodal imaging strategies is continuously enriching product pipelines and expanding application scenarios, steering the overall market toward higher efficiency and greater precision, while the competitive landscape becomes increasingly diverse and specialized.
