A PTA high pressure balloon catheter is an interventional medical device used in percutaneous transluminal angioplasty (PTA). By inflating a balloon at high pressure within a stenotic or occluded vessel, it compresses atherosclerotic plaque, enlarges the vessel lumen, and restores blood flow. These products are characterized by high rated burst pressure, controlled compliance, and precise dimensional consistency, and are primarily used in the treatment of peripheral arterial disease and other vascular interventions.

Upstream mainly includes medical-grade polymer materials (such as nylon, PET, and PEBA), metal hypotubes, radiopaque marker materials, coating materials, and precision extrusion and forming equipment. The midstream consists of manufacturers responsible for the design, production, assembly, and sterilization of PTA high pressure balloon catheters, with core capabilities focused on balloon forming technology, pressure performance control, and product consistency. Downstream applications are concentrated in hospital cardiovascular and peripheral vascular interventional departments, with procurement typically conducted through centralized hospital tenders or interventional device distribution channels.
