The PTC heating chip is a heating element with positive temperature coefficient (Positive Temperature Coefficient, PTC) characteristics. When the PTC heating chip is powered on, its resistance increases as the temperature rises, causing the chip itself to generate heat. This characteristic gives the PTC heating chip unique advantages in temperature control and constant temperature heating. PTC heating chips are usually made of materials such as iron oxide and have high resistivity and thermal conductivity. When the current passing through the PTC heating chip increases, the chip temperature also increases and the resistance value increases, thereby limiting further increase in current and achieving its own temperature control and stable heating.

The global PTC Heating Chip market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
