The global PTCA Guidewire market size is predicted to grow from US\$ 1790 million in 2025 to US\$ 2660 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

PTCA guidewire refers to a coronary guide wire used for interventional procedures related to percutaneous transluminal coronary angioplasty, with a typical specification of about 0.014 inches in diameter. It enters the coronary artery through the radial artery or femoral artery, crosses narrow or occluded lesions under fluoroscopy guidance, and provides a 'track' for instruments such as balloon dilation, stent delivery, intracavitary imaging and functional examination. Its core performance is determined by the shape and hardness gradient of the head end, torque transmission and controllability, pushing force and support force, coating lubrication and passability, as well as visibility and safety. In 2025, global PTCA Guidewire production reached approximately 65.36 M Units, with an average global market price of around US\$ 28 per Units.

PTCA guidewire is a typical high-frequency disposable consumable, with a high demand for chassis and PCI surgical volume, showing a stable growth trend but obvious structural upgrading. On the one hand, centralized procurement and cost control have driven down the price of basic work guide wire, intensified competition for standard products, and scale and stable supply have become the key to winning in the mid to low end market; On the other hand, the increasing proportion of complex lesions has driven an increase in demand for high-end segmentation, such as calcification, bifurcation, tortuosity, chronic complete occlusion, and other scenarios that rely more on high torque and high passability, differentiated coatings, and finer head end designs. This has led to an increase in the proportion of high-value models such as controllable through wires and CTO wires. The focus of competition among manufacturers has shifted from simple price to clinical scene coverage, model matrix integrity, doctor's usage habits, stickiness, and real-world evidence accumulation; At the same time, the

trend of materials and processes is towards lower friction and more durable composite coatings, more stable core and winding structures, more controllable hardness segmentation, and more consistent inter batch quality evolution. Coupled with domestic substitution and localized supply chain construction, the market pattern will continue to develop towards the direction of 'low-end scale and high-end differentiation parallel'.
