Polytetrafluoroethylene (PTFE) is commonly used as a matrix of composite materials for friction units in vehicles, because of its distinctive antifriction properties, and high chemical and frost resistances. Pure PTFE has limited applications as an engineering material, due to its low wear resistance and cold flow. Various base materials with impregnated PTFE are the basic form and there are abundant run-ups of fabrics, tapes, belts, architectural fabrics, composite films, etc. Due to its excellent temperature resistance, non-stick and chemical resistance, it can be used in various industries such as aviation, semiconductors, electronics, automobiles and chemical fields.

The global PTFE Composite Material market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
