PTFE is a synthetic fluoropolymer composed of tetrafluoroethylene. Its excellent properties make it used in a wide range of applications. Since it is composed of two elements, carbon and fluorine, which are combined with high molecular weight molecules, PTFE is a solid material. The PTFE diaphragm is a kind of PTFE sheet, which is made by special treatment and then heat-pressing and shaping. It can be made by molding or cutting sheets of polytetrafluoroethylene suspension resin, quenched, and then repeatedly rolled in different directions; it can also be made by dispersion resin molding and sintering and quenching. It has high elasticity, toughness and fatigue resistance.
