PTFE flame retardant additives are a type of additive primarily composed of polytetrafluoroethylene (PTFE), characterized by their unique chemical structure and exceptional performance, which distinguish them within the field of flame retardants. PTFE inherently exhibits excellent heat resistance and chemical stability, forming a stable protective layer on the material's surface that effectively insulates oxygen and heat, thereby significantly enhancing the flame retardancy of the material. These additives not only help to reduce the flame spread rate and smoke release during combustion but also meet environmental standards by being free of halogens and other toxic components. While improving material safety, PTFE flame retardant additives also maintain other physical and mechanical properties of the material, such as impact strength and tensile strength, making them an ideal choice for enhancing the overall performance of materials.

United States market for PTFE Flame Retardant Additives is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
