PTFE copper-clad laminate is currently the high-frequency substrate with the best electrical performance in the high-frequency substrate industry, far better than high-frequency substrates produced by epoxy resin, polytetrafluoroethylene resin and ppo resin materials. However, due to the molecular inertness of PTFE resin itself, it has physical properties that are not easily combined with copper foil. As a result, the adhesion of PTFE copper-clad laminates is much lower than that of high-frequency substrates produced with other resins, which has a certain impact on physical reliability.

The global PTFE Resin High Frequency CCL market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
