A Pull Rod Type Displacement Sensor, also known as a Linear Variable Displacement Sensor, is a device used to measure the linear movement or displacement of an object. It operates on the principle of converting linear motion into an electrical signal. The sensor typically consists of a Pull Rod connected to a resistive or capacitive element. As the rod moves, the resistance or capacitance changes, which is detected by the sensor and converted into an electrical signal proportional to the displacement. These sensors are widely used in industrial applications, such as robotics, automation, and machinery, where precise measurement of linear movement is essential.

The global Pull Rod Type Displacement Sensor market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
