A pull rope displacement sensor is a type of sensor that measures the linear displacement or movement of an object by using a pull rope or cable. The sensor typically consists of a pulley system that is connected to the object being measured, and as the object moves, the pull rope is pulled or released, causing the sensor to detect the change in position. This information is then converted into an electrical signal that can be used to monitor and control the movement of the object. Pull rope displacement sensors are commonly used in industrial applications such as conveyor systems, cranes, and robotic arms.
