The Pulse Bag Filter is an efficient, reliable, economical and practical dust removal and purification equipment. It is suitable for dust purification and material recovery in industries such as metallurgy, machinery, building materials, electricity, chemical industry, medicine, and food processing. Its working principle is that the dust-containing gas enters the filter chamber from the ash hopper (or the spacious open flange at the bottom), and the coarser particles fall directly into the ash hopper or ash bin. The dusty gas is filtered by the filter bag, and the dust is retained on the surface of the filter bag. The clean air passes through the bag mouth to the clean air chamber and is discharged into the atmosphere by the fan. When the dust on the surface of the filter bag continues to increase, causing the equipment resistance to rise to the set value, the time relay (or micro differential pressure controller) outputs a signal, the program controller starts to work, opens the pulse valve one by one, and the compressed air is blown through the nozzle to clean the filter bag, causing the filter bag to expand suddenly. Under the action of the reverse airflow, the dust attached to the surface of the filter bag quickly breaks away from the filter bag and falls into the ash hopper (or ash bin), and the dust is discharged by the ash discharge valve. After all the filter bags are sprayed and cleaned, the dust collector resumes normal operation.

The global Pulse Bag Filter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
