Pulse Subcellular Irradiator is a specialized instrument used in molecular and cellular biology research to deliver precise light pulses to cells or subcellular regions within cells. This technique is known as optogenetics, and it allows researchers to control specific cellular processes with high temporal and spatial precision using genetically encoded light-sensitive proteins. The Pulse Subcellular Irradiator works by delivering brief, high-intensity pulses of light to specific areas of the cell. The light pulses are generated by a pulsed laser and delivered through an optical fiber to the target area.

The system can be used to activate or inhibit specific cellular processes, such as ion channels or signaling pathways, in a reversible and non-invasive manner. Overall, the Pulse Subcellular Irradiator is a powerful tool for investigating the complex mechanisms underlying cellular function and development, and has numerous potential applications in fields such as neuroscience, immunology, and cancer research.
